PRACTIC[®]

IsoteQ PRACTIC with its unique, patented technical procedure helps us to transport the heat-insulating layers and the plastic connections separately onto location! It is easy to fit and the result is the same IsoteQ wall form with extreme tensile strength. we could transport even 2,5 times more elements than before on the same volume, which lowers the transport charges. The thickness of the concrete core is variable (15 cm or 20 cm).

PRACTIC UNIVERSAL

Our new products has a wide range of use: for example to insulate the foundation, the plinth or the inferior purlin while they can be connected to the IsoteQ blocks. *The shape, the material (NEOPOR 2400), the density (25 kg/m³) and the heat transmission coefficient ($\lambda=0,029$ W/mK) of these insulating panels are the same as at the IsoteQ PRACTIC elements. But these panels doesn't contain plastic elements, which makes the cutting much easier.*
